

# 2D VIBROSEISMIC ACQUISITION IN SUD TOZEUR AND JORF AREA (Tunisia)

From January to March 2007, a seismic survey was conducted by **Geo2X** in the Sud Tozeur and Jorf area, some 400 km SSW of Tunis on behalf of **RIGO OIL**. The prospect was around 225 km of full fold seismic. It consisted on 12 seismic lines.

Permitting was mandatory to gain access on some line portions (Jorf area). The accessibility of the relief enabled the client to use vibrators as source on the two site.

Pre-processing was performed using FOCUS software. Stacked migrated sections were provided to the client on site.
